How can I reduce the risk of getting breast cancer?

You may help to reduce your risk and look after your health generally by:
- Maintaining a healthy weight by combining a balanced, low fat diet with regular physical activity. Being overweight after the menopause increases a woman’s risk of breast cancer.
- Doing regular exercise – women who are physically active are less likely to develop breast cancer than less active women. Try to do at least 30 minutes of moderate physical activity five times or more a week. The more active you are, the more you can reduce the risk.
- Not drinking too much alcohol – The more you cut down on alcohol, the more you can reduce the risk of breast cancer and many other cancers.
- Breast feed your baby.
- If you smoke – stop; if you don’t – don’t start. Some research suggests that smoking increases the risk of breast cancer.
- Getting to know your breasts. If you notice a change, see your GP as soon as possible. Nine out of ten breast changes are not due to cancer but it is very important to make sure.

What is breast screening and when can I have it?

Breast screening aims to find cancers at an early stage when they are too small for you to see or feel. When breast cancer is found at an early stage, there is an excellent chance of successful treatment.

Women in Ireland are invited for a mammogram (breast x-ray) every two years from ages 50 to 64. This is a free service offered by BreastCheck which is the National Breast Screening Programme.

Make sure that you are on the register by contacting BreastCheck on Freephone 1800 45 45 55 or checking online at www.breastcheck.ie

The Breast Awareness 5-point Code
- Know what is normal for you
- Know what changes to look and feel for
- Look and feel for changes
- Report any changes to your doctor without delay
- Attend routine breast screening if you are aged between 50 and 64
breast cancer
the facts

- Breast cancer is the second most common cancer in women in Ireland, skin cancer being the most common. However the number of breast cancer cases is on the increase
- Every year 2,600 cases are diagnosed and 660 women die from the disease in Ireland
- Breast cancer is most common in women from 50 years onwards but it can be diagnosed at a younger age
- 1 in 10 women will be diagnosed with breast cancer in their lifetime
- If you are worried about your risk of breast cancer, contact your family doctor

What is breast cancer?
The breast is made up of millions of cells. Breast cancer develops when a single cell or group of cells begins to multiply out of control and forms a tumour.
The breasts consist of fatty tissue and lobules that are connected to the nipple by ducts. Breast cancer usually starts in cells that line a duct or lobule. Sometimes cells can break away and travel to other parts of the body, starting new tumours.

Risks of getting breast cancer

This section is about things that affect the risk of breast cancer. Even if you have one or more of the risk factors overleaf, it doesn’t mean you will definitely develop breast cancer.

Breast cancer is not fully understood but we do know some of the risk factors that increase a woman’s chance of getting breast cancer. Knowing about these risks can help you to take important steps to look after yourself.

Key Risk Factors

1. Being a woman
2. Starting your periods at a younger age or having a late menopause increases the risk of breast cancer.
3. A family history – women who have relatives with breast cancer have a higher risk of developing the disease themselves. Risk increases with the number of close relatives diagnosed. But even so, almost nine out of 10 breast cancers occur in women with no close relatives diagnosed with the disease.
4. Getting older – the risk of developing breast cancer goes up with age. The older you are, the greater your chances of developing the disease.
   Around four out of five breast cancers occur in women aged 50 and over.
5. Hormones and reproduction – the female sex hormone, oestrogen, can affect the development of breast cancer. Many of the things that affect the risk of breast cancer can be explained through their effect on hormone levels. Taking hormone replacement therapy (HRT) or oral contraceptives (also known as the pill) increases the risk of breast cancer. But HRT is an effective treatment for menopausal symptoms, and the pill also reduces the risk of ovarian and womb cancers. If you are considering starting or stopping HRT or the Pill, or if you have any concerns, see your doctor.
6. Having no children – having no children or having your first child after age 30 can slightly increase your risk.

Be breast aware

One of the most important things that you can do for your health is to get to know your breasts. Breast cancer is one of the most common female cancers so it is important to look after your breasts by being breast aware. Being aware means getting to know how your breasts look and feel so you know what is normal for you. You can then feel more confident about noticing any unusual changes.

Women themselves find most lumps. Remember that most breast lumps are not due to cancer but you don’t know if you don’t ask.

Even though it is uncommon, men can also get breast cancer so they need to be breast aware too.

Early detection provides the best possible chance of surviving the disease.

How can I be breast aware?

Breast awareness means becoming familiar with your breasts and how they look and feel at different times of the month. Try to get used to looking at and feeling your breasts regularly. By doing this you will be able to notice any changes that aren’t usual for you.

Use times like having a bath or shower to notice how your breasts look and feel. Running a soapy hand over your breast helps you to feel the texture of your breast more easily. You may notice that your breasts change in size, shape or in how they feel at different times of the month.

Your breasts may become lumpier or more tender around the time of your menstrual period, for example. As you become familiar with your breasts you’ll become more confident in knowing what is normal for you.

What to look out for?

- Any lumps, thickening or bumpy areas in the breast or armpit that seem different from other breast tissue.
- Any changes in the size, shape or feel of the breast (it may be normal for you to have one breast larger than the other)
- Changes to the nipple, such as crusty, ulceration, bleeding or a change in the direction or shape of the nipple
- An unusual discharge from one or both of your nipples
- Veins that are standing out more than usual for you
- Any puckering, dimpling or redness of the skin of the breast
- Swelling in your armpit or around your collarbone
- Pain or discomfort that is new to you and felt only on one side
